# 1 Order of Element

ex. What are the possible orders of an element  $[n] \in \mathbb{Z}/5\mathbb{Z}$   $5 = |\mathbb{Z}/5\mathbb{Z}|$  is prime so by Proposition 2.6.3, every element is either order 1 or order 5.

note: Any order 5 element generates  $\mathbb{Z}/5\mathbb{Z}$

example: what are the possible homomorphism from  $\mathbb{Z}/3\mathbb{Z}$  to  $\mathbb{Z}/6\mathbb{Z}$ ?

Recall if  $f : G \rightarrow K$  is a homomorphism then  $\ker f \leq G$  and  $\text{im } f \leq K$

note: if  $\text{ord}(g) = n$  then  $e_k = f(e_G) = f(g^n) = f(g)^n$

so  $f(g)$  is of order divides  $n$ . by proposition 2.6.3 (3) – check notes from previous lecture

$$\begin{aligned} &\mathbb{Z}/3\mathbb{Z} \\ \text{ord}([0]) &= 1 \\ \text{ord}([1]) &= \text{ord}([2]) = 3 \\ &\mathbb{Z}/6\mathbb{Z} \\ \text{ord}([0]) &= 1 \\ \text{ord}([1]) &= \text{ord}([5]) = 6 \\ \text{ord}([2]) &= \text{ord}([4]) = 3 \\ \text{ord}([3]) &= 2 \end{aligned}$$

What homomorphisms are possible ??

$$\begin{aligned} f([0]) &= [0] \\ f([1]) &= [0] \text{ or } [2] \text{ or } [4] \\ f([2]) &= f([1] + [1]) = f([1]) + f([1]) \end{aligned}$$

so there is 3. homo morphisms

**Definition 1.1** (2.7.1).

A cyclic group is a group  $G$  containing an element  $g$  such that  $G = \langle g \rangle$ . The element  $g$  is called the generator of  $G$  and we say that  $G$  is generated by  $g$ .

example:  $\mathbb{Z}/n\mathbb{Z}$  is generated by  $[1]$  or  $[n-1]$

Can there be an infinite cyclic group? yes; the  $\mathbb{Z}$  (under addition) is cyclic that is generated by 1 or -1.

**Proposition 1.1.** Any cyclic group is isomorphic to  $\mathbb{Z}/n\mathbb{Z}$  for some  $n \in \mathbb{N}$

Note:  $0\mathbb{Z} = \{0\}$ ,  $\mathbb{Z}/0\mathbb{Z} = \mathbb{Z}$ ,  $\mathbb{Z}/1\mathbb{Z} = \{0\}$

*Proof.*

Consider  $G = \langle g \rangle$  thus

$$\begin{aligned} f_g : \mathbb{Z} &\rightarrow G \\ f_g(n) &= g^n \end{aligned}$$

is a surjective homomorphism then  $\text{Ker}(f_g)$  is a subgroup of  $\mathbb{Z}$  and in Proposition 2.2.3, we proved every subgroup of  $\mathbb{Z}$  is of the form of  $n\mathbb{Z}$  for some  $n \in \mathbb{N}$  so  $\text{Ker}(f_g) = n_g\mathbb{Z}$  for some  $n_g \in \mathbb{N}$  and by the first isomorphism theorem,  $\mathbb{Z}/n_g\mathbb{Z} \cong G \cong \mathbb{Z}/\text{Ker}(f_g)$

□

recall from HW the  $n^{\text{th}}$  roots of unity are:

$$z_k = e^{2\pi i k/n} \text{ for } k = 0, 1, 2, \dots, n-1$$

## 1.1 exercise

the  $n$ th roots of unity are a cyclic group generated by  $z_1 = e^{2\pi i/n}$  and is isomorphic to  $\mathbb{Z}/n\mathbb{Z}$  concrete example and its proof; taking a look at 4-th roots of unity. draw it:

$$\{1, i, -1, -i\} \cong (\mathbb{Z}/4\mathbb{Z}, +)$$

$$1 \rightarrow [0] : \text{identity}$$

$$i \rightarrow [1]$$

$$-1 \rightarrow i^2 = [1] + [1] = [2]$$

$$-i \rightarrow [3]$$

**Proposition 1.2** (2.7.2).

A group  $G$  of prime order  $|G| = p$  is cyclic and isomorphic to  $\mathbb{Z}/p\mathbb{Z}$

*Proof.*

Let  $g \in G$  such that  $g \neq e$  and let  $H = \langle g \rangle$ . Since  $H \leq G$  and by Lagrange Theorem,  $|H|$  divides  $|G| = p$  so  $|H| = 1$  or  $p$  but  $g \neq e$  so  $|H| = p$  and  $H = G$  so  $G = \langle g \rangle$  and  $G$  is cyclic.

□

## Cyclic groups of composite order

Q: What about cyclic groups with orders not prime?

Lets look at  $\mathbb{Z}/12\mathbb{Z}$

$$\begin{aligned}
ord[0] &= 1 \\
ord[1] &= ord[5] = 12 \\
ord[2] &= ord[10] = 6 \\
ord[3] &= ord[9] = 4 \\
ord[4] &= ord[8] = 3 \\
ord[6] &= ord[6] = 2 \\
ord[7] &= ord[11] = 12
\end{aligned}$$

we can see a pattern here.  $[1], [5], [7], [11]$  are the generators of  $\mathbb{Z}/12\mathbb{Z}$  and  $\mathbb{Z}/12\mathbb{Z}$  is isomorphic to  $\mathbb{Z}/12\mathbb{Z}$

**Definition 1.2.** Let  $n \in \mathbb{Z}$  the Euler  $\phi$  function is defined as  $\phi(n) = |\{k \in \mathbb{Z} | 1 \leq k \leq n \text{ and } \gcd(k, n) = 1\}|$

**Lemma 1.3** (Cor 1.5.10).

Let  $a, b, c \in \mathbb{Z}$  If  $\gcd(a, b) = 1$  and  $a|bc$  then  $a|c$

see textbook for proof

**Proposition 1.4** (2.7.4).

let  $G$  be a cyclic group

1. every subgroup of  $G$  is cyclic
2. Suppose  $G$  is finite and  $d$  is a divisor of  $|G|$  Then  $G$  contains a unique subgroup  $H$  of order  $d$  for each  $d| |G|$  and this subgroup is cyclic.
